Abstracts

Artificial blood cells, also known as synthetic oxygen carriers or hemoglobin-based oxygen carriers (HBOCs), are bioengineered substitutes designed to mimic the oxygen-carrying function of natural red blood cells, aiming to address critical shortages in blood transfusions, reduce dependency on donor blood, and eliminate risks associated with blood type incompatibility and pathogen transmission. These products typically fall into two categories: perfluorocarbon-based emulsions, which dissolve and transport oxygen passively, and hemoglobin-based solutions derived from human, animal, or recombinant sources, engineered to maximize oxygen delivery while minimizing toxicity. Their development focuses on applications in trauma care, elective surgery, and scenarios where stored blood is unavailable or impractical, representing an innovative convergence of biotechnology, materials science, and clinical medicine aimed at overcoming limitations of conventional transfusion medicine.

The global Artificial Blood Cells market size was estimated at USD 350.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 12.50% during the forecast period.
