Abstracts

The market for artificial cardiac valves encompasses medical devices surgically implanted into the heart to replace or repair damaged or diseased native valves, primarily the aortic and mitral valves, to restore proper blood flow and cardiac function; these devices are categorized into mechanical valves, made from durable synthetic materials like pyrolytic carbon and requiring lifelong anticoagulation therapy, and bioprosthetic valves, derived from animal tissues (such as porcine or bovine pericardium) which do not typically necessitate long-term blood thinners but have limited durability and may require reoperation. The market is driven by the rising global prevalence of valvular heart diseases—often linked to aging populations, rheumatic heart disease in developing regions, and degenerative conditions in developed economies—alongside advancements in valve design, minimally invasive surgical techniques, and the growing adoption of transcatheter valve replacement procedures, which offer alternatives to traditional open-heart surgery for high-risk patients. Key players include globally recognized medical technology firms that invest heavily in research and development to enhance valve longevity, reduce complications, and expand indications for use, while regulatory approvals, reimbursement policies, and regional healthcare infrastructure significantly influence market accessibility and growth patterns across different geographies.

The global Artificial Cardiac Valves market size was estimated at USD 5028.45 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.30% during the forecast period.
