Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Artificial Cartilage Material competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global production of artificial cartilage material reached 6.57 m³, with an average selling price of US\$23/cm³. Artificial cartilage material is a type of metamaterial developed based on biomimetic principles. Its core design mimics the microstructure and function of human articular cartilage, creating a three-dimensional ultramicrostructure that combines high energy absorption, fatigue resistance, and environmental adaptability. This material typically consists of a mixture of nanoscale pores and soft matrix cells. Its microstructure includes micrometer-scale interconnected pores and nanoscale surface grooves and protrusions. This multi-level structure enables it to convert over 90% of the impact kinetic energy into heat through mechanisms such as hysteretic deformation and viscoelastic dissipation, achieving efficient energy absorption and dispersion.

The global Artificial Cartilage Material market size was estimated at USD 151.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.40% during the forecast period.

This report offers a comprehensive and in-depth analysis of the global Artificial Cartilage Material market, covering all critical facets from a broad macroeconomic overview to detailed micro-level insights.
