Report Overview

The artificial chest wall belongs to the prosthesis transplanted into the human body by surgery. It is composed of a tough film layer and artificial ribs sandwiched therein, and there are stainless steel wires in the ribs. The flexible membrane layer is made of knitted polyester cloth and the artificial ribs are made of low pressure polyethylene. During the operation, the stainless steel wire is wound around the fracture end of the human body rib, and the tough film layer and the physiological tissue around the wound are sutured with polyester fiber thread. The artificial chest wall is applied to the repair of chest wall defects, which can avoid chest wall deformity and fully restore chest wall function after rehabilitation.
