Abstracts

Artificial disc prostheses are medical devices designed to replace a damaged or degenerated intervertebral disc in the spine, aiming to restore natural motion, maintain disc height, and alleviate pain while preserving segmental mobility, unlike spinal fusion procedures which eliminate movement at the treated level. These implants typically consist of biocompatible materials such as metal alloys, polymers, or a combination, and are engineered to mimic the biomechanical function of a natural disc through features like articulation, shock absorption, and load distribution. The technology is primarily indicated for conditions like degenerative disc disease, herniated discs, or spinal instability in the cervical or lumbar regions, offering a motion-preserving alternative for select patients who meet specific clinical criteria, such as the absence of significant facet joint arthritis or deformities.

The global Artificial Disc Prostheses market size was estimated at USD 754.3 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.48% during the forecast period.
