Abstracts

Artificial graphite film, also known as artificial graphite heat dissipation film or synthetic graphite sheet, is a high-performance thermal management material composed of expanded graphite processed through high-temperature graphitization, calendaring, and lamination to form ultra-thin, flexible sheets with exceptional in-plane thermal conductivity, typically ranging from 300 to 1,900 W/m²K, while remaining electrically insulating and lightweight. It functions by rapidly spreading heat laterally across surfaces, making it particularly effective in dissipating thermal energy in compact electronic devices where localized hotspots occur. The material is characterized by its flexibility, chemical stability, and ability to conform to irregular shapes, enabling integration into space-constrained applications such as smartphones, tablets, laptops, LED lighting, and electric vehicle battery systems. Its production involves polymer pyrolysis or natural graphite expansion followed by compression, resulting in a highly oriented crystalline structure that facilitates efficient phonon transport along the planar direction, though it exhibits comparatively lower through-plane thermal conductivity.

The global Artificial Graphite Film market size was estimated at USD 1250.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
