Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Artificial Grass Fiber competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Artificial grass fibers are divided into open mesh and monofilament in structure, straight and curved in appearance, and all are extruded grass fibers in production process. Depending on the application field and user group, artificial turf products have different specifications for grass fibers in terms of pattern and weight to ensure that the grass fibers have good performance. Different types of needs are mainly achieved by developing diversified grass fiber molds, accurately batching, shaping, and controlling weight during the grass fiber production process. Artificial turf is divided into straight filament lawn, curved filament lawn, open mesh filament lawn, straight and curved mixed turf, straight filament open mesh mixed turf, etc. according to the different grass fiber combinations. The weaving technology mainly includes tufting technology and warp knitting technology. Tufting technology passes the grass fibers into the yarn guide tube and then weaves them on the base cloth to form a turf embryo blanket; warp knitting technology directly weaves the grass fibers with polyester to form a turf embryo blanket. According to the length of grass fiber, it can be divided into long grass, medium grass and short grass. Grass with a length of 32 to 50 mm or more can be classified as long grass; grass with a length of 19 to 32 mm can be classified as medium grass; grass with a length of 6 to 12 mm can be classified as short grass. Tufting technology Warp knitting technology
