Abstracts

Artificial hearts are being used to help patients with total heart failure live normal lives past their life expectancy time line, or to help patients survive until their transplant date either by replacing the heart completely or by replacing the ventricles. The device is surgically implanted in the chest in order to help in the functioning of a deteriorating heart. An artificial heart may also be used temporarily and is removed once the heart starts functioning normally. In cases where the damage is severe, the biological heart is completely replaced with the artificial heart. An artificial heart is powered by either compressed air or electricity.
