Abstracts

Artificial hip joint implant refers to a medical device surgically implanted to replace a damaged or diseased hip joint, typically composed of biocompatible materials such as titanium, cobalt-chromium alloys, ceramic, or highly cross-linked polyethylene, designed to restore mobility, alleviate pain, and improve quality of life for patients suffering from conditions like osteoarthritis, rheumatoid arthritis, avascular necrosis, or traumatic fractures. These implants are engineered to mimic the natural ball-and-socket structure of the hip joint, with modular components including the femoral stem, femoral head, acetabular cup, and liner, and are available in various fixation types?cemented, cementless, or hybrid?depending on patient bone quality and surgical approach. The product category encompasses primary total hip arthroplasty systems as well as revision implants for failed prior procedures, with ongoing innovations in materials, bearing surfaces, and minimally invasive surgical techniques aimed at enhancing longevity, reducing wear, and minimizing complications such as dislocation or implant loosening.

The global Artificial Hip Joint Implant market size was estimated at USD 7816.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.45% during the forecast period.
