Abstracts

Artificial intelligence (AI) is becoming established as a new method for analysing ophthalmological data, and unveiling new clinical and pathogenic insights into retinal diseases. AI-based algorithms are largely employed in the field of the most prevalent retinal diseases, including diabetic retinopathy, age-related macular degeneration and myopia. Diabetes continues to rise throughout the United States and worldwide. Estimates show that the prevalence of diabetes mellitus will rise to 578 million people (10.2%) by the year 2030 and 700 million people (10.9%) by the year 2045. This increase in the prevalence of diabetes can also lead to a corresponding increase in diabetic complications, including nephropathy, cardiovascular disease, neuropathy, and retinopathy. It is estimated that vision-threatening diabetic retinopathy (vtDR) is present in around 22% of patients with diabetes, with clinically significant macular edema present in about 4% of patients, although the numbers can widely vary based on the population and access to care. Regardless of the exact numbers, there is no doubt that diabetic retinopathy remains a significant health burden and cause of visual loss. Early detection of diabetic retinopathy is key, because early treatment and lifestyle modifications can help prevent or minimize vision-threatening complications.

The global Artificial Intelligence Eye Screening Software market size was estimated at USD 227.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 84.00% during the forecast period.
