## Abstracts

A large language model (LLM) is a type of language model notable for its ability to achieve general-purpose language understanding and generation. LLMs acquire these abilities by using massive amounts of data to learn billions of parameters during training and consuming large computational resources during their training and operation. LLMs are artificial neural networks (mainly transformers) and are (pre-)trained using self-supervised learning and semi-supervised learning. As autoregressive language models, they work by taking an input text and repeatedly predicting the next token or word. Up to 2020, fine tuning was the only way a model could be adapted to be able to accomplish specific tasks. Larger sized models, such as GPT-4, however, can be prompt-engineered to achieve similar results. They are thought to acquire embodied knowledge about syntax, semantics and "ontology" inherent in human language corpora, but also inaccuracies and biases present in the corpora. The key players of Large Language Model (LLM) include Open AI(ChatGPT), Google(PaLM) and Meta (LLaMA), etc. The top three players hold a share over 86%. North America is the largest market, has a share about 53%. In terms of product type, Below 100 Billion Parameters is the largest segment, occupied for a share of about 70%. In terms of application, Chatbots and Virtual Assistants has a share about 32%.

The global Artificial Intelligence Large Language Models market size was estimated at USD 7691.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 79.80% during the forecast period.
