Report Overview

A large language model (LLM) is a type of language model notable for its ability to achieve general-purpose language understanding and generation. LLMs acquire these abilities by using massive amounts of data to learn billions of parameters during training and consuming large computational resources during their training and operation. LLMs are artificial neural networks (mainly transformers) and are (pre-)trained using self-supervised learning and semi-supervised learning. As autoregressive language models, they work by taking an input text and repeatedly predicting the next token or word. Up to 2020, fine tuning was the only way a model could be adapted to be able to accomplish specific tasks. Larger sized models, such as GPT-4, however, can be prompt-engineered to achieve similar results. They are thought to acquire embodied knowledge about syntax, semantics and 'ontology' inherent in human language corpora, but also inaccuracies and biases present in the corpora.

The global Artificial Intelligence Large Language Models market size was estimated at USD 1591 million in 2023 and is projected to reach USD 312447.72 million by 2032, exhibiting a CAGR of 79.80% during the forecast period.

North America Artificial Intelligence Large Language Models market size was estimated at USD 1175.66 million in 2023, at a CAGR of 68.40% during the forecast period of 2024 through 2032.
