Abstracts

The artificial liver support system is an extracorporeal support system that temporarily replaces some functions of the liver. Its therapeutic mechanism is based on the strong regenerative ability of liver cells. Through mechanical, physical, chemical and biological devices in vitro, it can remove various harmful substances, supplement essential substances, and improve internal organs. The environment creates conditions for liver cell regeneration and liver function recovery, or serves as a bridge before liver transplantation. It can be divided into three types: non-biological, biological and mixed. Some possible market drivers for Artificial Liver are: The increasing prevalence of liver diseases and liver failure, which require effective and timely treatment to prevent mortality and morbidity. The growing demand for alternative therapies and devices that can temporarily or permanently replace the liver function, especially for patients who are not eligible for liver transplantation or face long waiting lists. The rising innovation and development of artificial liver technologies, such as bioartificial liver systems (BALs) and molecular adsorbent recirculating systems (MARS), that can mimic the metabolic and detoxification functions of the liver using biological or synthetic components. The expanding market opportunities and customer base for artificial liver providers across different regions and industries, especially in emerging markets where the incidence of liver diseases is high and the availability of liver transplantation is low.

The global Artificial Liver Support Systems market size was estimated at USD 6269.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
