Report Overview

This report focus on Artificial Nose market.

The mammalian olfactory system is able to detect many more odorants than the number of receptors it has by utilizing cross-reactive odorant receptors that generate unique response patterns for each odorant. Mimicking the mammalian system, artificial noses combine cross-reactive sensor arrays with pattern recognition algorithms to create robust odor-discrimination systems.

An array of chemical sensors is used to mimic the range of protein receptors in the human nose. Each of these sensors is made to respond differently to different odors. The signals from these sensors are connected via electronics to a microprocessor or computer. The electronics replaces the neurons in the olfactory limbic system and the computer or microprocessor acts as the brain. The signals that get sent to the computer can be interpreted using special pattern recognition software.
