## Abstracts

Artificial sweeteners are sugar substitutes, which have a sweet taste and are produced synthetically. As of now they are used as a sugar alternative since they contain low calories, and help maintain low blood sugar levels. They are widely used in processed foods such as powdered drink mixes, candies, jams & jellies, baked goods, dairy products, and other similar food & beverages to maintain the taste and simultaneously make it healthier. Major artificial sweeteners include aspartame, saccharin, and sodium benzoate. Aspartame is widely used as a table top sweetener in the market. It is around 200 times sweeter than ordinary sugar and is used in low calorie desserts, sugar-free chewing gums, cereals, tea, coffee, yogurt, milk formulations, etc. Due to the rising awareness and health consciousness among people, the demand for low calorie sugar alternatives and sugar-free products are increasing, which boost the market growth. Hence, food processing companies produce low calorie and sugar-free alternatives as their major products, which in turn helps stimulate the market growth. However, the long-term usage of these can trigger diabetes as it can interrupt with the body's ability to regulate blood sugar,
