Abstracts

An artillery pointing system is a sophisticated combination of mechanical, optical, and often electronic components designed to accurately direct and aim artillery pieces, such as cannons, howitzers, and mortars. It enables the precise adjustment of the elevation and azimuth angles of the artillery weapon to ensure that projectiles are fired towards a specific target location. Mechanically, it includes structures like turrets and traversing mechanisms that allow for smooth movement and positioning of the barrel. Optically, it may incorporate sighting devices, such as telescopic sights or periscopes, to provide the gun crew with a clear view of the target and surrounding terrain for aiming. In modern systems, electronic components play a crucial role, with features like computerized fire control systems that can calculate aiming solutions based on factors such as the distance to the target, the type of ammunition being used, weather conditions (including wind speed and direction, temperature, and humidity), and the characteristics of the artillery piece itself. These systems also often interface with navigation and communication equipment, allowing for real-time updates and coordination with other units on the battlefield, all with the ultimate goal of maximizing the accuracy and effectiveness of artillery fire.

The global Artillery Pointing System market size was estimated at USD 429.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 3.80% during the forecast period.
