Abstracts

The aspartate transaminase (AST) test, also known as the serum glutamic-oxaloacetic transaminase (SGOT) test, is a blood-based diagnostic assay used to measure the level of the AST enzyme in serum, which is released into the bloodstream when cells in organs such as the liver, heart, skeletal muscles, kidneys, and pancreas are damaged or undergo stress. It is a critical component of liver function panels and is widely utilized in clinical settings to screen for, diagnose, and monitor liver diseases?including hepatitis, cirrhosis, and drug-induced liver injury?as well as to assess cardiac damage in conditions like myocardial infarction, though it is now often supplemented or replaced by more cardiac-specific biomarkers such as troponin. The test is performed using automated clinical chemistry analyzers in hospitals, reference laboratories, and point-of-care settings, with methodologies including spectrophotometry and immunoassays that offer high sensitivity, precision, and rapid turnaround times. As a routine and essential tool in hepatology, cardiology, and general medicine, the AST test is integral to global healthcare diagnostics, with demand driven by the rising prevalence of liver disorders, cardiovascular diseases, and lifestyle-related health issues, as well as increasing accessibility to medical testing in both developed and emerging markets.

The global Aspartate Transaminase Test market size was estimated at USD 150.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
