Abstracts

Asphalt anchors are specialized fasteners designed to attach various structures to asphalt surfaces. Usually made of materials like zinc-plated carbon steel, dacromet, or stainless steel. It has an elongated shape with an external thread or a structure that can bond with the grout. Some asphalt anchors have a spiral design on the surface to enhance the bonding force with the grout and asphalt. Accessories include bolts, washers, and grout. The bolt is used to connect the anchored object to the anchor, and the washer is placed between the bolt head and the anchor to evenly distribute the force and protect the anchor and the asphalt surface. The grout is a crucial component for bonding the anchor to the asphalt. Asphalt anchors work by drilling a hole in the asphalt surface, filling it with grout, and then inserting the anchor into the hole. The grout bonds with both the asphalt and the anchor, creating a strong connection. As the grout cures, it fills the cracks and crevices in the asphalt and the gravel below, distributing the forces exerted on the anchor over a larger area, thus enabling the anchor to withstand significant pull and shear forces.

The global Asphalt Anchor market size was estimated at USD 259.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.90% during the forecast period.
