Abstracts

An asphalt repair material is used to repair aging asphalt that has become cracked, dented, or worn due to vehicle traffic or weather conditions. Asphalt repair materials are used in various situations, regardless of the size of the project, from repairing aging asphalt to temporary restoration work, as well as repairing parking lots and pavement to prevent weeds. There are two types of repair materials: the volatile hardening type, which can be easily purchased at home centers, etc. It can be applied simply by pouring the repair material into the area to be repaired and applying rolling pressure. The chemical reaction type, in which hardening, is accelerated by pouring water on the poured area. The application and characteristics of each type differ, so they are used differently depending on the type of construction. Chemical reaction type repair materials are the most suitable for road repair work because they are all-weather type and can be used in rainy or wet conditions. While the volatile hardening type is inferior in terms of durability, it does not require water and can be applied simply by applying pressure with a shovel or similar tool, so it is used for temporary pipe restoration work.

The global Asphalt Repair Materials market size was estimated at USD 4876.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
