Abstracts

An aspherical cylindrical lens is a specialized optical component designed with at least one surface that is cylindrical and non-spherical, meaning its curvature varies across the lens profile to correct optical aberrations?particularly astigmatism and coma?that spherical lenses cannot adequately address. These lenses are engineered to focus or diverge light in only one plane, producing a line image rather than a point, and are distinct from standard spherical or rotationally symmetric aspheric lenses due to their asymmetric curvature. They are primarily used in applications requiring precise beam shaping, such as laser line generation, barcode scanning, anamorphic optics in cinematography, and corrective optics in laser diode systems, where controlling astigmatism and minimizing distortion are critical.

The global Aspherical Cylindrical Lens market size was estimated at USD 165.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 7.45% during the forecast period.
