Report Overview

Aspiration is a medical term that refers to the withdrawal of air and fluids from the body. Aspiration of body fluids is necessary for sample collection required for diagnostic and therapeutic application and to determine the future course of treatment for various disorders. Few key procedures in which the aspiration is necessary include: Aspiration of joint fluids (Arthrocentesis), Aspiration of ascitic fluids in the peritoneal cavity (Paracentesis), Cerebro Spinal Fluid (CSF) Aspiration, Breast Cyst aspiration, bone marrow transplant procedures, and ophthalmic procedures. For instance, in bone marrow aspiration, a small amount of bone marrow is withdrawn from the bone and examined for various disease conditions.

Aspiration control systems consist of a fully automated sterile system with a motor and vacuum pump that is being controlled to deliver precise and continuously variable vacuum within a vacuum chamber, and surgical hand piece for convenient aspiration of bone marrow and other fluids during surgery.

The system is purely based on suction technology in which the adjustable mechanical vacuum controller maintains a favorable vacuity with sensitive suction power.
