Report Overview

The assembled hip prosthesis is an artificial prosthesis used for artificial hip replacement surgery. In hip replacement surgery, a patient's damaged portion of the hip joint is removed and replaced with an artificial prosthesis to restore hip function and relieve pain. The assembled hip prosthesis is composed of multiple components, usually including the acetabular component, femoral stem, acetabular head and other parts. These components can be customized and assembled based on the patient's bone structure and individual differences for optimal fit and functionality. During the operation, the doctor will select appropriate components based on the patient's specific conditions, and perform appropriate adjustments and installations to ensure that the prosthesis is tightly integrated with the surrounding bone tissue and can provide stable support and normal joint motion. The design and assembly of prefabricated hip prostheses can make surgery more personalized to meet the special needs of patients, and can be adjusted and replaced according to intraoperative conditions to provide the best surgical results and patient experience.
