Abstracts

Assembled joint prostheses represent a category of orthopedic implants designed to replace damaged or diseased human joints, such as hips, knees, shoulders, or elbows, through modular components that are assembled during surgery to allow for greater customization, improved anatomical fit, and enhanced surgical flexibility compared to monolithic, one-piece implants. These devices typically consist of multiple parts?such as stems, heads, liners, and trays?manufactured from biocompatible materials like titanium alloys, cobalt-chromium, ceramics, or highly cross-linked polyethylene, which are engineered to articulate smoothly, withstand physiological loads, and promote long-term osseointegration. The assembly feature enables surgeons to adjust for variations in patient anatomy, bone quality, and ligament balance, while also facilitating potential future revision surgeries by allowing selective replacement of worn components rather than full implant removal.

The global Assembled Joint Prosthesis market size was estimated at USD 3514.2 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
