Report Overview

Astatine-211 is an isotope of the chemical element astatine (symbol: At) with extremely high radioactivity. The half-life of astatine-211 is 7.2 hours, which is a relatively long-lived astatine isotope. Astatine-211 is an alpha particle emitter that continuously releases alpha particles consisting of two protons and two neutrons. The chemical properties of astatine are similar to those of other halogens, such as iodine, but the radioactivity of astatine-211 greatly limits the study of its chemical properties. It can be used to form chemical bonds with metal organic derivatives (such as tin) or carborane precursors, combined with molecular carriers targeting malignant tumor cell groups, to prepare alpha nuclide targeted therapeutic drugs.

The global Astatine-211 market size was estimated at USD 5.70 million in 2023 and is projected to reach USD 102.12 million by 2032, exhibiting a CAGR of 37.80% during the forecast period.

North America Astatine-211 market size was estimated at USD 2.60 million in 2023, at a CAGR of 32.40% during the forecast period of 2024 through 2032.
