Report Overview:

Astaxanthin (CAS 472-61-7) is a naturally occurring dark red carotenoid found in nature primarily in aquatic animals such as salmon, trout, krill, shrimp, crayfish, and crustaceans. Astaxanthin is more than just a red pigment, it is one of the most powerful lipophilic antioxidants yet discovered. It has the unique capacity to quench free radicals and reactive species of oxygen and to inhibit lipid peroxidation. Studies have shown Natural Astaxanthin to be over 500 times stronger than vitamin E and much more potent than other carotenoids such as lutein, lycopene and β -carotene. Moreover, Astaxanthin a xanthophyll carotenoid, is a nutrient with a unique molecule structure, it does not convert to vitamin a (retinol) and has no "pro-oxidant" activity. Natural astaxanthin is biosynthesized by living microalgae (*H. Pluvialis*). Natural astaxanthin in supplements is typically produced by a specific type of microalgae (*Haematococcus pluvialis*), and also occurs in fish and crustaceans that consume this algae, including shrimp, salmon and krill. Natural astaxanthin is a dietary supplement with extremely powerful antioxidant benefits for human applications. According to the purity in the commercial market, the product can be divided to be various types based on the two types: Astaxanthin Oleoresin and Astaxanthin Powder. Currently, the major commercially available sources of synthetic astaxanthin come from petrochemicals. The chemical difference between natural and synthetic astaxanthin lies in the stereochemical orientation of the molecules in space (those different molecules are called "enantiomers"). astaxanthin exists in three main enantiomeric forms, termed 3S-3'S, 3R-3'S, and 3R-3'R.

The Global Astaxanthin Market Size was estimated at USD 226.25 million in 2023 and is projected to reach USD 398.64 million by 2029, exhibiting a CAGR of 9.90% during the forecast period.
