Abstracts

Asthma therapeutic drugs encompass a range of pharmaceutical products designed to manage and treat asthma, a chronic respiratory condition characterized by airway inflammation, bronchoconstriction, and hyperresponsiveness. These medications are broadly categorized into two main types: quick-relief drugs (such as short-acting beta-agonists like albuterol) that provide immediate symptom relief during asthma attacks by rapidly relaxing airway muscles, and long-term control medications (including inhaled corticosteroids, long-acting beta-agonists, leukotriene modifiers, and biologics) that are used daily to reduce inflammation, prevent symptoms, and minimize the frequency and severity of exacerbations. The market for these drugs is driven by the global prevalence of asthma, advancements in drug delivery systems, increasing awareness and diagnosis rates, and the growing emphasis on personalized medicine approaches that target specific inflammatory pathways in severe asthma cases.

The global Asthma Therapeutic Drug market size was estimated at USD 21200.0 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.50% during the forecast period.
