Astronomy Telescope Control Software is a dedicated program for remote or local operation of astronomical telescope systems. Its core function is to achieve precise control of telescope hardware and automate the observation process. Serving as the communication hub between the observer and the telescope, the software integrates control of key components such as the telescope mount (equatorial/aerial), camera, filter wheel, focuser, dome/mask, and guiding equipment through standardized driver protocols such as ASCOM and INDI. Key functions include telescope pointing and tracking control, coordinate system conversion and calibration, target import and observation sequence scheduling, autofocus, guiding correction, and safety monitoring. It is not only a convenient tool for amateur deep-sky photography or visual observation, but also a critical infrastructure for professional observatories to achieve remote, efficient, and unattended observations.

The global Astronomy Telescope Control Software market size was estimated at USD 79.58 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.20% during the forecast period.
