## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Asynchronous Dual-Port DRAM competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global asynchronous dual-port DRAM production reached 21,355,000 units, with an average selling price of USD 17.5 per unit. Asynchronous dual-port DRAM is a type of dynamic random access memory with two independent access ports, independent of the system clock, and supporting asynchronous concurrent access. Its dual-port structure enables simultaneous read and write operations by multiple devices/controllers. Combined with the capacitor storage characteristics of DRAM, data must be periodically refreshed to maintain data, and conflicts must be resolved through asynchronous logic. In 2024, global asynchronous dual-port DRAM single-line production capacity will reach 647,100 units per year. The total cost of a single Multi-port Memory is approximately US\$12, with a gross profit of approximately US\$5.4 and a gross profit margin of 31%. Asynchronous dual-port DRAM's upstream market is semiconductor materials and manufacturing equipment, represented by companies such as Shin-Etsu Chemical, Sumitomo Chemical, Tokyo Electron, and Applied Materials. Its downstream market is multi-processor communication systems, industrial control equipment, high-speed data acquisition platforms, and aerospace electronics systems. Typical applications include dual-CPU collaborative processing, real-time data sharing, and high-concurrency access scenarios.

The global Asynchronous Dual-Port DRAM market size was estimated at USD 374.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
