Abstracts

Asynchronous FIFO (First-In, First-Out) memory refers to a specialized digital circuit designed to safely transfer data between two independent clock domains, where the write and read operations occur at different, unsynchronized frequencies. These memory buffers are critical in systems-on-chip (SoCs), networking equipment, and high-speed data interfaces, as they prevent metastability and data corruption by employing synchronization techniques such as Gray code counters for address pointers and handshake protocols to manage cross-clock domain data flow. Unlike synchronous FIFOs, which operate under a single clock, asynchronous FIFOs require careful design to handle timing uncertainties, making them essential components in applications involving clock domain crossing (CDC), such as processor-peripheral communication, multi-core architectures, and serial data links.

The global Asynchronous Fifo Memory market size was estimated at USD 450.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.50% during the forecast period.
