## Abstracts

Asynchronous servo drives are a type of servo drive based on asynchronous motors, mainly used in industrial applications that require high power, large torque and dynamic performance. Compared with synchronous servo drives, asynchronous servo drives generally have higher durability, lower cost and less maintenance requirements. Although the accuracy and response speed of asynchronous servo drives may be slightly inferior to those of synchronous servo drives, they perform well under heavy loads and harsh environments. Based on variable frequency speed regulation technology, asynchronous servo drives achieve precise control of the motor through vector control or direct torque control. This control method greatly improves the dynamic response of asynchronous motors, enabling them to meet more complex servo control requirements.

The global Asynchronous Servo Drive market size was estimated at USD 1968.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.80% during the forecast period.
