Abstracts

At-home capsule endoscopy refers to a medical diagnostic procedure where a patient swallows a small, pill-sized, wireless camera that captures images of the gastrointestinal (GI) tract?particularly the small intestine, which is difficult to access with traditional endoscopy?over several hours while the patient carries out normal daily activities at home. The capsule transmits images to a wearable data recorder, which are later reviewed by healthcare professionals to detect abnormalities such as bleeding, inflammation, polyps, or Crohn's disease. This minimally invasive technology eliminates the need for sedation or hospitalization, offering greater patient comfort and convenience while maintaining diagnostic accuracy comparable to conventional methods for certain indications.

The global At Home Capsule Endoscopy market size was estimated at USD 520.75 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 5.20% during the forecast period.
