## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Atactic Polyvinyl Chloride competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Atactic Polyvinyl Chloride (a-PVC) is a type of polyvinyl chloride polymer characterized by a random arrangement of its molecular side groups along the polymer chain, as opposed to isotactic or syndiotactic configurations. This irregular structure prevents crystallization, resulting in an amorphous, soft, and tacky material with low mechanical strength and thermal stability. a-PVC is typically formed as a byproduct during the suspension or emulsion polymerization of vinyl chloride monomer (VCM). While standard PVC (largely syndiotactic) is widely used for pipes, cables, and profiles due to its rigidity and durability, atactic PVC is generally considered a waste or secondary product, though it can be used in blends, adhesives, coatings, or as a plasticizer-modified component in certain niche applications.

The global Atactic Polyvinyl Chloride market size was estimated at USD 194.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.70% during the forecast period.
