Abstracts

Atmospheric gas burners are combustion devices that utilize ambient air for combustion without the aid of forced air systems such as blowers or fans; these burners operate on the principle of venturi effect, where the flow of gas draws in the necessary air for combustion directly from the surrounding atmosphere, making them simpler, quieter, and more energy-efficient than power burners, though generally limited to applications with lower thermal demands or where precise control of combustion is less critical, such as in residential heating systems, water heaters, cooktops, and some light industrial processes.

The global Atmospheric Gas Burner market size was estimated at USD 350.25 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 3.45% during the forecast period.
