Abstracts

Atomic polishing service refers to polishing the surface of the workpiece to atomic-level flatness through physical or chemical methods to achieve surface roughness control to atomic size. This polishing technology is mainly used in semiconductor manufacturing, optical manufacturing and other fields to meet applications with extremely high requirements for surface flatness. Atomic polishing services can achieve nanometer-level polishing accuracy, and the surface roughness can be controlled below 0.5 nanometers (1-2 atomic layer thickness). The polished surface has high quality, extremely low surface defects and contamination, and can meet the needs of high-end manufacturing. This technology is widely used in semiconductor manufacturing, optical manufacturing and other fields, and is of great significance for improving product quality and performance. The atomic polishing service market, especially the CMP (chemical mechanical polishing) polishing service market, is a vital component of the semiconductor industry. With the advancement of integrated circuit technology, the demand for CMP polishing materials has continued to increase, driving the expansion of the market. As a high-value, high-consumption material, CMP polishing materials have attracted a lot of capital to enter this field, driving the increase in the number of supply companies. In addition, with the advancement of technology, more automated CMP polishing equipment has appeared on the market, which can automatically complete the polishing process through preset programs, improving production efficiency and product quality. In summary, the atomic polishing service market, especially the CMP polishing service market, is continuing to develop and grow.

The global Atomic Polishing Service market size was estimated at USD 3045.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.00% during the forecast period.
