Report Overview

Atomic polishing service refers to polishing the surface of the workpiece to atomic-level flatness through physical or chemical methods to achieve surface roughness control to atomic size. This polishing technology is mainly used in semiconductor manufacturing, optical manufacturing and other fields to meet applications with extremely high requirements for surface flatness. Atomic polishing services can achieve nanometer-level polishing accuracy, and the surface roughness can be controlled below 0.5 nanometers (1-2 atomic layer thickness). The polished surface has high quality, extremely low surface defects and contamination, and can meet the needs of high-end manufacturing. This technology is widely used in semiconductor manufacturing, optical manufacturing and other fields, and is of great significance for improving product quality and performance.
