Abstracts

Atomized bronze powder is a finely divided metallic powder produced through atomization, a process where molten bronze is disintegrated into droplets using high-pressure gas or water jets, which then solidify into spherical or irregular particles; this material is characterized by its composition—typically an alloy of copper and tin, though other elements like aluminum or silicon may be present—and finds primary application in powder metallurgy for manufacturing sintered components, as a feedstock for metal injection molding (MIM), in brazing and soldering pastes, coatings, conductive inks, and decorative or anti-corrosion surface treatments, with key properties including controlled particle size distribution, high purity, good flowability, and sinterability.

The global Atomized Bronze Powder market size was estimated at USD 320.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
