### Report Overview

The ATR probe consists of an ATR crystal tip at the end of the immersible section (the so-called shaft) and a mid-IR optical fiber split into 2 branches with an SMA connector. The ATR uses the total internal reflection properties of the crystal, which produces an evanescent wave. It extends into the sample medium, which may be a liquid, slurry or solid, and is used to measure media with very high optical density. It can be inserted directly into the sample for spectral measurements without diluting the sample.
