Abstracts

The ATR probe consists of an ATR crystal tip at the end of the immersible section (the so-called shaft) and a mid-IR optical fiber split into 2 branches with an SMA connector. The ATR uses the total internal reflection properties of the crystal, which produces an evanescent wave. It extends into the sample medium, which may be a liquid, slurry or solid, and is used to measure media with very high optical density. It can be inserted directly into the sample for spectral measurements without diluting the sample.

The global Attenuated Total Reflection Probes market size was estimated at USD 25.45 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
