Report Overview

An attenuator is an electronics device which helps in reducing power or amplitude without appreciably distorting the waveform. An optical attenuator is a passive device used to control the power of an optical signal, either within an optical fiber or in a free space. Attenuators are generally used when the signal coming at the receiver end is too strong and is thus capable of overpowering the receiving elements. Some devices, such as video camcorders and low priced analog cassette recorders, do not have line inputs. In these devices, attenuator cables are used to filter sound. Attenuator cables help in reducing the optical signal power of optical devices. Many people think that the power of optical signals is higher the better. Thus, in most cases, people use fiber amplifiers to increase the power of optical signals.

Increasing demand for attenuation from ultrasound and telecommunication sectors is spurring demand in the attenuation cables market. In these sectors, attenuators help in determining signal strength as a function of distance. However, attenuator cables cannot be used between a set of recorders and microphones, if microphones are powered by recorder's mic input (called plug-in power). This particular factor may hamper the growth of attenuator cables market.
