Report Overview:

Audio driver IC, also known as switching amplifier or class-D amplifier is an electronic device in which the amplifying devices such as transistors act as switches and not as linear devices as in the case of other amplifiers. The analog signal is converted into a series of pulses with the help of pulse width modulation or pulse density modulation before it is applied to the driver/amplifier. The output pulse if passed through a low pass filter can be converted back to an analog signal.

The Global Audio Driver IC Market Size was estimated at USD 3003.90 million in 2023 and is projected to reach USD 6558.84 million by 2029, exhibiting a CAGR of 13.90% during the forecast period.
