Report Overview:

Autism spectrum disorder is a biologically based neurodevelopmental disorder characterized by persistent deficits in social communication and social interaction and restricted, repetitive patterns of behavior, interests and activities. Diagnosing autism spectrum disorder (ASD) can be difficult, since there is no medical test, like a blood test, to diagnose the disorders. Doctors look at the child's behavior and development to make a diagnosis. Our report studies the market from 2014-2025, examining programs and medications used to the patient with autism.

Symptoms and Signs

Autism spectrum disorders may manifest during the first year of life but, depending on severity of symptoms, diagnosis may not be clear until school age.

Two main features characterize autism spectrum disorders:

Persistent deficits in social communication and interaction

Restricted, repetitive patterns of behavior, interests, and/or activities

Both of these features must be present at a young age (although they may not be recognized at the time) and must be severe enough to significantly impair the child's ability to function at home, school, or other situations. Manifestations must be more pronounced than expected for the child's developmental level and adjusted for norms in different cultures.

The Global Autism Spectrum Disorder Market Size was estimated at USD 7391.53 million in 2023 and is projected to reach USD 9033.53 million by 2029, exhibiting a CAGR of 3.40% during the forecast period.
