Abstracts

An Auto Recloser Controller is an intelligent electronic device used in electrical power distribution systems to automatically detect, isolate, and attempt to restore power following a temporary fault, such as a tree branch or animal contact with a power line. It functions by monitoring the electrical circuit for abnormalities, tripping the circuit breaker upon fault detection, and then executing a predetermined sequence of reclosures after a brief delay to allow transient faults to clear; if the fault persists after a set number of attempts, the controller locks out the recloser to prevent repeated operations on a permanent fault, thereby minimizing outage duration for temporary issues while protecting infrastructure and ensuring system reliability.

The global Auto Recloser Controller market size was estimated at USD 625.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
