Abstracts

Autologous fat grafting refers to a surgical procedure in which a patient's own adipose tissue is harvested, processed, and reinjected into another part of their body for aesthetic or reconstructive purposes, commonly used in facial rejuvenation, breast augmentation, scar revision, and buttock enhancement (Brazilian butt lift). The technique leverages the patient's natural tissue, reducing the risk of allergic reactions or rejection, and is valued for its dual benefit of removing unwanted fat from one area while volumizing or contouring another. Advances in purification methods such as centrifugation, filtration, and washing have improved graft survival rates and outcomes, while emerging applications extend into regenerative medicine, where adipose-derived stem cells are utilized to promote healing and tissue regeneration.

The global Autologous Fat Grafting market size was estimated at USD 386.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
