Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Automated Poultry Farming System competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. In 2024, global Automated Poultry Farming System production reached approximately 78.3k units, with an average global market price of around US\$ 3650 per unit. The Automated Poultry Farming System is a comprehensive technical system that integrates advanced technologies such as sensors, the Internet of Things, and artificial intelligence. It monitors and controls the poultry farming environment in real time, automates daily management tasks such as feeding, watering, egg collection, and manure cleaning, and combines data analysis with intelligent decision-making models to optimize farming processes, improve production efficiency, and reduce labor costs and disease risks. Its core goal is to achieve efficient, controllable, and sustainable development throughout the entire poultry farming cycle through precise, unmanned or minimally staffed operation modes, while also supporting customized applications of different scales and scenarios. Global production of automated poultry farming systems is projected to reach 78,300 units in 2024, an increase of approximately 8.3% year-on-year. This is primarily driven by rising labor costs, stricter food safety standards, and the widespread adoption of intelligent farming technologies. Regionally, Asia-Pacific (particularly China and India), driven by the expansion of large-scale poultry farms, contributes 45% of global production. Europe and North America, driven by the need for technological upgrades, hold a combined 35% market share. The average selling price of systems varies significantly depending on their functional configuration: basic environmental control systems (including sensors and simple automation modules) cost approximately \$2,800 per unit and are suitable for small and medium-sized farms. High-end systems integrating AI decision-making and renewable energy drive systems cost

between \$12,000 and \$35,000 per unit and are primarily targeted at large, intensive farming operations. Furthermore, the use of rental service models and sharing platforms (such as intelligent feeding systems with a pay-per-cycle fee) are gradually lowering the initial investment barrier for small and medium-sized farmers, driving further market penetration.

The global Automated Poultry Farming System market size was estimated at USD 283.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.60% during the forecast period.
