Report Overview

Thermal Desorption Instrument is the instrument adopts thermal desorption theory to increase the volatility of dependents or contaminants such that they can be removed (separated) from the solid matrix (typically soil, sludge or filter cake). Thermal desorption is not incineration. The volatilized contaminants are then either collected or thermally destroyed. A thermal desorption system therefore has two major components; the desorber itself and the offgas treatment system. It is an environmental remediation technology that can be utilized in environmental air monitoring and exposure to chemicals at work, residual volatiles and materials emissions testing, food, flavour, fragrance & odour profiling, and defence and forensic, etc.

The global Automated Thermal Desorption Systems market size was estimated at USD 16 million in 2023 and is projected to reach USD 19.81 million by 2030, exhibiting a CAGR of 3.10% during the forecast period.
