Abstracts

An automated train system, also known as an automated or driverless train system, refers to a rail transportation network where trains operate without direct human intervention, relying instead on a combination of onboard computers, sensors, communication-based train control (CBTC) technology, and centralized control systems to manage acceleration, braking, door operation, routing, and safety protocols. These systems can range from fully automated, unattended trains?common in metros, light rail, and people movers?to semi-automated implementations where human operators may still be present for supervision or emergency intervention. The core components typically include automated train operation (ATO), automatic train protection (ATP), and automatic train supervision (ATS), integrated to ensure precision, efficiency, and enhanced safety over traditional manually operated services.

The global Automated Train System market size was estimated at USD 7562.4 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 6.80% during the forecast period.
