Abstracts

Automated Transdermal Diffusion Cell System is a laboratory device used to study the absorption of substances through the skin, typically for the development of transdermal drug delivery systems. It consists of multiple diffusion cells that simulate the skin's barrier function, allowing for the controlled release and measurement of drugs or other compounds as they pass through the skin layers. The system is automated to handle the repetitive tasks of monitoring, sampling, and adjusting parameters such as temperature and pH, enabling precise and efficient testing of how substances permeate the skin over time. This technology is essential in evaluating the effectiveness and safety of transdermal formulations.

The global Automated Transdermal Diffusion Cell System market size was estimated at USD 72.2 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
