Report Overview:

The Automated Valet Parking (AVP) is used to realize fully autonomous vehicle autonomous driving in a specific area from the entrance/exit of the parking lot to the parking space, because of its low driving speed and the ability to maximize the specific operating site. The feature of ensuring safety is recognized by the industry as the first L4-level autonomous driving scene to be implemented. Automated Valet Parking is the first and last step of autonomous driving. The 'first step' refers to the one-button summon function, and the 'last step' is the one-button parking function. The basic requirements of the one-button parking function are: the user gets off the car at the designated drop-off point, and issues a parking instruction through the mobile APP. After receiving the instruction, the vehicle can automatically drive to the parking space in the parking lot, without user manipulation and monitoring. If multiple vehicles receive the parking instruction at the same time, the automatic waiting of multiple vehicles to enter the parking space can be realized. The basic requirements of the one-key calling function are: the user issues a car pickup order through the mobile phone APP, and the vehicle can automatically drive from the parking space to the designated pickup point after receiving the order.

The Global Automated Valet Parking (AVP) Market Size was estimated at USD 578.29 million in 2023 and is projected to reach USD 3857.18 million by 2029, exhibiting a CAGR of 37.20% during the forecast period.
