Report Overview

Automatic coagulation analysis pipeline is a medical laboratory equipment used to analyze coagulation disorders in blood samples. This is a highly automated machine that can perform a wide range of tests to assess the blood coagulation status of patients, including coagulation time, coagulation factor measurement, and platelet function testing. The machine works by collecting a small amount of blood from a patient and passing it through a series of sensors and detectors. These sensors measure the clotting time of blood and the activity of various coagulation factors and platelets, enabling machines to identify and diagnose coagulation disorders. Automated blood coagulation analysis pipelines can quickly and accurately analyze large amounts of blood samples, making them an important tool for medical laboratories and hospitals. It is used for a wide range of applications, including the diagnosis and monitoring of hemorrhagic diseases such as hemophilia and vascular hemophilia, as well as evaluating the risk of thrombosis, such as deep vein thrombosis and pulmonary embolism.
