Abstracts

An automatic cream separator is an electromechanical device designed to separate milk into its constituent components?primarily cream and skimmed milk?through centrifugal force, operating without manual intervention once configured. It functions by spinning milk at high speeds within a drum or bowl, where denser skim milk is forced outward while lighter cream collects centrally, with automated controls regulating speed, temperature, and output consistency. These systems often include features such as self-cleaning mechanisms, adjustable fat content settings, and integration with digital monitoring tools to enhance efficiency, hygiene, and precision in dairy processing. Widely used in both small-scale farms and industrial dairy operations, automatic cream separators improve productivity, ensure standardized product quality, and reduce labor compared to traditional manual or semi-automatic methods.

The global Automatic Cream Separator market size was estimated at USD 460.5 million in 2024 and is projected to grow at a compound annual growth rate (CAGR) of 4.85% during the forecast period.
